Kaarina Mattika, CS87A, Section 1758 <https://github.com/kmattika/cs82a-portfolio>

```
[1]: # Straightforward loop using if / elif / else conditionals. The cutoffs for
    ↪ each category is 'cold', 'warm', and 'hot' following the textbook's
    # sample problem. I chose to follow it exactly as it gave useful parameters to
    ↪ match - one category with 'equal to or larger / smaller than'
    # more closely mirrors a real-world scenario of exact detail given for a
    ↪ project. In this case, any temperature of less than 15 degrees is 'cold',
    # any temperature equal to or between 15 and 25 is 'warm', and any other
    ↪ temperature is 'hot'. Given the known dataset, I could have technically
    # made this loop more efficient by listing the 'warm' temperature first, due to
    ↪ it having three data points compared to the two each for 'hot' and
    # 'cold'. However, in a real world scenario where this list may be continuously
    ↪ updated and refreshed with new data, it makes more sense to have
    # it be intuitive instead of efficient.
```

```
Temperatures = [10, 16, 23, 28, 14, 22, 30]
```

```
for temperature in Temperatures:
```

```
    if temperature < 15:
        print("Cold")
    elif 15 <= temperature <= 25:
        print("Warm")
    else:
        print("Hot")
```

```
Cold
Warm
Warm
Hot
Cold
Warm
Hot
```
